

PERSISTENT INFECTION? PREDICTABLE RESULT.

INTRODUCING BREED-BACK™ FP.

DON'T LET PERSISTENT BVD INFECTION DRAIN PROFIT FROM YOUR OPERATION.

Losses from BVD infection can be extremely costly. Despite sound management, the virus can enter your herd via *PI* (persistently infected) animals. Now there is a vaccine specifically engineered for fetal protection. BREED-BACK™ FP. It stimulates the dam's immune system to such a high level that BVD virus is neutralized before it can cross the placenta and infect the fetus.

- Engineered to enable the cow to provide the fetus with a shield of protection from BVD Types 1 & 2 virus
- Controlled studies show 90-99% efficacy in preventing *PI* calves due to BVD Types 1 & 2
- The only fetal protection vaccine **that actually contains** both BVD Types 1 & 2
- MLV for fast, long-lasting immunity
- Available in four convenient combinations for Sub-Q administration

Protect yourself from economic loss due to persistently infected animals. Vaccinate with new BREED-BACK FP.

Real Protection. Real Profit.
